

Send money home that builds capital, instead of losing to inflation.

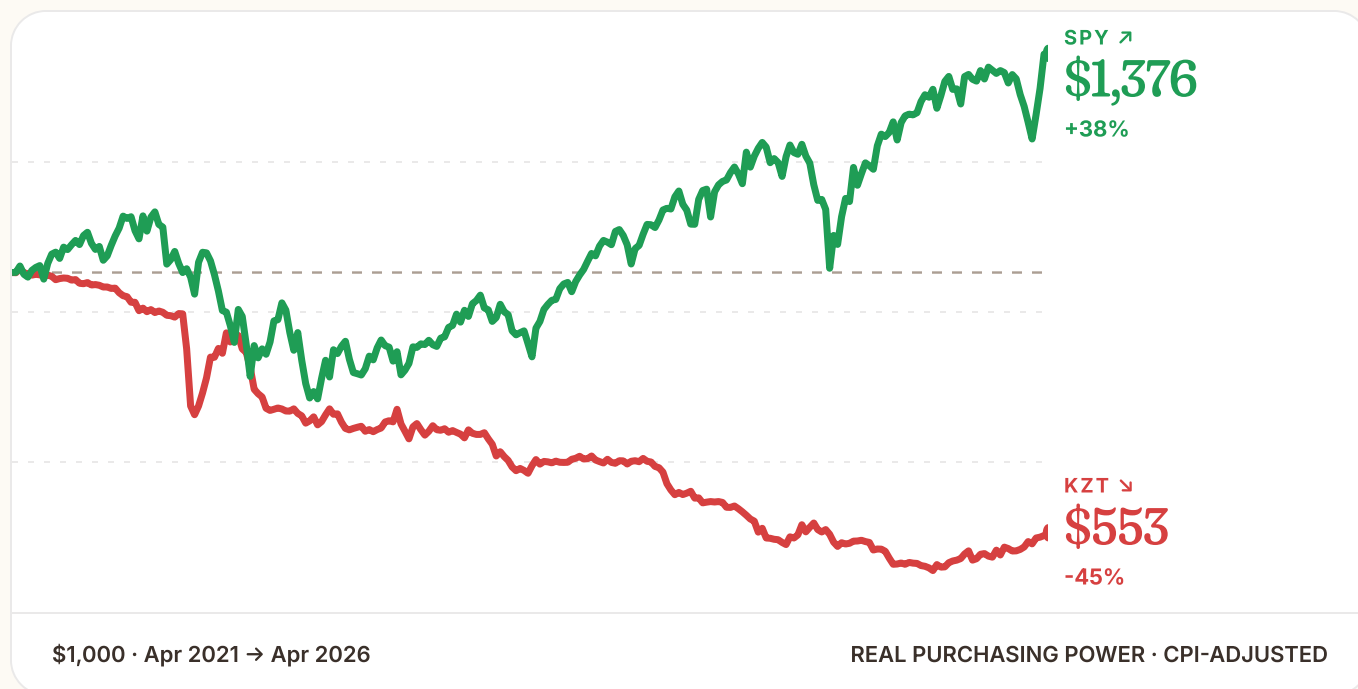

A non-custodial family vault on Solana. USDC in, tokenized real-world assets out.

COLOSSEUM FRONTIER · SUPERTeam KZ · 2026

Aigerim Dildakhanova · Frederik Bussler

01 · THE PROBLEM

The tenge your family saved is worth less each year.

11.2% AVG ANNUAL CPI

Kazakhstan consumer inflation averaged 11.2% per year since 2021, peaking at 20.3% in 2022.

-44% REAL PURCHASING POWER

The tenge lost roughly 44% of its real purchasing power against USD over five years.

~\$300/mo AVG DIASPORA REMITTANCE

Average diaspora remittance from UAE and Turkey to KZ arrives as tenge and erodes on arrival.

The diaspora sends money home. It erodes before the family can use it.

An estimated 1.5M+ ethnic Kazakhs live and work abroad. The UAE and Turkey corridors grow fastest. Annual personal remittances to Kazakhstan run into the hundreds of millions of dollars. Most of it lands as tenge and starts losing value the day it arrives.

Tumar: a family vault that turns remittance into a portfolio.

- 01 Any card funds any exchange**
S1lkPay, Kaspi, VISA, Mastercard. Off-ramp banks, not us.
- 02 Exchange converts fiat → USDC**
Binance, Bybit, Coinbase, Phantom onramp — users already know these.
- 03 Tumar vault receives on Solana**
Non-custodial PDA. 20 on-chain assets, Jupiter v6 auto-allocation.
- 04 Trilingual UI, family never opens Phantom**
English, Russian, Kazakh. One Solana Pay QR per family vault.

S1lkPay, Kaspi, etc are card issuers — not crypto rails. Tumar is the last mile.

[Try it live · /terminal →](#)

The infrastructure to build this didn't exist 18 months ago.

Performance	
Block time	400 ms
Sustained TPS	4,500
Median fee	\$0.0002
Settlement	Sub-second

Liquidity	
Native USDC	\$8B+
DeFi TVL	\$5B+
Bridge needed	None
L2 fragmentation	None

RWAs live today	
Backed xStocks	17 tickers
Redemption	Real, off-chain
Token standard	SPL
Composability	Every primitive

Tumar is not possible on Ethereum L1 at these transaction sizes. Not possible on L2s without bridging. Solana is the only stack where diaspora-scale remittance, real equity exposure, and composability work today — and it's also why we can reach users Freedom Broker's rails can't: wallet-native, permissionless, no residency gate, no trading-hour cutoff.

Any card → any exchange → Tumar vault.

The diaspora already knows how to buy USDC — Binance, Bybit, Coinbase, Phantom's onramp — using any card they already hold. Tumar is the last mile: Solana Pay QR → family vault → auto-allocate.

S1lkPay, Kaspi and other card issuers have no crypto rails and no affiliation with Tumar. They appear only as examples of cards a user might fund an exchange with. Costs and timings illustrative.

Your SPY can work for you.

xStocks are SPL tokens. The same position the vault holds can collateralize a USDC loan on Kamino, earn supply yield on MarginFi, or LP on Orca — without selling the underlying. Not wired in the hackathon build; this is the roadmap the terminal's vault + Jupiter v6 integration unlocks.

Planned integrations. Yields drawn from each protocol's current public rates; illustrative, not a quote.

Sending money to family is not a public ledger entry.

Solana is public by default. For a family vault that aggregates salaries from three countries, that's a deal-breaker. Tumar integrates Cloak — a UTXO shielded pool with client-side Groth16 proofs — so the on-chain trail from your USDC source to the asset in your wallet is broken at the pool boundary.

What stays hidden	
Transfer amounts	Shielded UTXO
Source address	Pool boundary
Recipient counterparty	Stealth note
Timing fingerprint	Relay-submitted

What you keep	
Self-custody	User-signed shield
Asset choice	USDC → xStock
Settlement	Sub-second
Audit trail	Selectively shareable

Who can see	
You	Always
Family viewing key	Optional
Auditor scoped key	Optional, time-limited
Public ledger	Nothing

Apa never installs an app. Apa never trusts the cloud.

The grandmother in the village is the user with the highest stake and the lowest tolerance for cloud anything. Tumar ships a macOS app where the entire AI stack — language model, voice transcription — runs on her own laptop, fully offline, via Tether QVAC.

ON-DEVICE STACK

NETWORK

Zero

no API key, no cloud

WHAT IT UNLOCKS

- Private family-finance Q&A on the grandmother's laptop.
- Kazakh, Russian, English — voice in, voice or text out.
- On-chain contribution data → local LLM context → answer.
- No data leaves the machine. Ever.

LIVE TRANSCRIPT

APA, IN KAZAKH

“Aidana bul ay qansha saldy?”

How much did Aidana put in this month?

TUMAR, ON HER LAPTOP

“Aidana bul ay 500 dollar saldy. Vault qazir 1,840 dollar turady — 38% NVDAx, 22% SPYx, 17% PUSD...”

Round-trip

A vault that respects what your family believes.

Stablecoin choice isn't neutral. For Muslim families on the UAE side of the corridor, USDC's yield exposure isn't acceptable. Tumar treats Palm USD — non-freezable, fully reserved, no interest — as a first-class deposit asset, not an afterthought.

Non-freezable

MINT-LAYER COMPLIANCE

Compliance is enforced at permissioned mint and redeem only. No freeze, no blacklist, no pause function on the SPL token.

100%

CASH + SUKUK RESERVE

Sharia-compliant reserve structure: cash, commodity murabaha, sovereign sukuk. No interest-bearing US Treasury exposure.

0% interest

HALAL BY CONSTRUCTION

No staking yield, no rebasing, no overnight T-bill carry. The dollar you hold is the dollar you keep.

HOW TUMAR HANDLES IT

PUSD has no Jupiter route at the time of writing — its acquisition path is permissioned mint via the Palm Treasury, not a DEX. Tumar detects PUSD and routes through a direct transferChecked path with idempotent vault-ATA creation and on-chain contribution recording. Same UX, no swap, vault holds the actual PUSD.

PUSD MINT

Who's building this.

Aigerim Dildakhanova

ALMATY, KAZAKHSTAN

aigerim2001@proton.me

- Product design, cultural framing, trilingual UX.
- Chose the `txmap` naming — an amulet that protects what matters.
- This is her family's problem. Her parents save in tenge.

Frederik Bussler

NEW YORK, US

frederik@bussler.co

- Solana program architecture, vault design, xStocks + Jupiter integration.
- Prior: data / ML infra, 3x founder, Forbes / IBM contributor on applied crypto.

A cross-border team building a cross-border product.

Beyond the hackathon.

Q3 2026 MAINNET BETA

Invite-only rollout

- 100 families on the UAE → KZ corridor.
- Free Jupiter v6 rebalances during beta.
- Telegram + WhatsApp funnel for the diaspora.

Q4 2026 COMPLIANCE

AIFC sandbox + issuer relationships

- Astana International Financial Centre sandbox application.
- Direct issuer relationship with Backed for xStocks.
- Issuer-level KYC and sanctions screening layer.

2027 SCALE

Second corridor + vault lending

- Turkey → KZ corridor (second-largest diaspora flow).
- KZTE stablecoin in-country withdrawal rails.
- Vault-collateralized lending via Kamino.

We're not building a hackathon project. We're building the first real savings product for Kazakh families abroad.

түмар — an amulet that protects what matters.
